The Endocrine Society thanks the Subcommittee for the opportunity to submit the following testimony regarding Fiscal Year (FY) 2016 federal appropriations for biomedical research.

The Endocrine Society is the world's largest and most active professional organization of endocrinologists representing more than 18,000 members worldwide. Our organization is dedicated to promoting excellence in research, education, and clinical practice in the field of endocrinology.

**Funding for Endocrine-Related Research: An Investment in the Nation’s Health**

Sustained investment by the United States federal government in biomedical research has dramatically advanced the health and improved the lives of the American people. The United States’ NIH-supported scientists conduct research that has led to new medical treatments, saved innumerable lives, reduced human suffering, and spawned entire new industries.
Endocrinologists are a vital component of our nation’s biomedical research enterprise and integral to the healthcare infrastructure in the United States. Endocrine researchers study how hormones contribute to the overall function of the body, and how the glands and organs of the endocrine system work together to keep us healthy\(^1\). Consequently, endocrinologists have a unique approach and understanding of how the various systems of the human body communicate and interact to create a comprehensive picture of health.

Endocrinologists study and treat some of the most complex disease areas, such as diabetes, obesity, bone disease, thyroid disorders, and reproductive health. Many of these conditions represent growing areas of disease burden for the United States population. NIH-funded endocrine scientists continue to make remarkable contributions in areas of critical national interest, for example:

- Endocrine scientists found a direct correlation between low vitamin D levels and impaired glucose metabolism. This study suggests that outdoor activity may also affect the risk of developing diabetes\(^2\).
- Endocrine scientists discovered how the microbes living in our intestines change as people develop diabetes\(^3\).
- Endocrine research on obesity helped develop prevention and treatments resulting in a

---

43% decrease in the obesity rate for children age 2 to 5 years\textsuperscript{45}.

\textbf{The Future of Endocrine Research}

We are rapidly entering a new era of precision medicine. Insights into genetic and biologic markers can be used to understand what causes a disease, the risk factors that predispose to disease, and how patients will respond to a particular treatment. Translating these new discoveries and technologies into personalized patient care offers the possibility of more effective treatments, less toxicity, increased disease prevention, improved quality of life, and lower health care costs. Several endocrine-specific conditions are on the cusp of a breakthrough in diagnostic testing. The ability to test for specific genetic mutations that cause the syndrome of resistance to thyroid hormone can dramatically alter potential treatment options. Additionally, rare adrenal tumors called pheochromocytomas and paragangliomas are notoriously challenging to diagnose. More NIH-funded basic and clinical research to help us understand how genetics can predispose us to, or protect us from disease is critical to develop and refine genetic testing strategies so that they are more reliable and more widely available.

\textbf{Sequestration Threatens Scientific Momentum}

The Endocrine Society is particularly concerned about the impact of cuts on biomedical research supported by the NIH. At a time when we should be investing more in research to save more lives, research funding is in serious jeopardy. Since 2004, the number of NIH research grants to scientists in the United States has been declining. Consequently, the likelihood of a scientist

with a highly-regarded grant application successfully being awarded a new research grant has dropped from 31.5% in 2000 to 18.1% in 2014\(^5\). This means that experienced scientists are increasingly spending time writing grant applications instead of applying their expertise to productive research. Additionally, younger scientists struggle to find jobs that make use of the unique skills developed during graduate training.

We may never be able to quantify the opportunities we have missed to improve the health and economic status of the United States due to persistent underinvestment in research. We do know however, that when “laboratories lose financing; they lose people, ideas, innovations and patient treatments\(^6\).” Based on the personal stories of researchers who have been forced to curtail research programs, we know that research programs to understand how genetics can influence heart disease, develop therapeutic treatments for Parkinson’s disease, and evaluate the effect of metal contaminants on reproductive health, among many others, are delayed or terminated\(^7\).

**FY 2016 NIH Funding Request**

The Endocrine Society recommends that the Subcommittee provide at least $32 billion in funding for NIH in the FY 2016 Labor-HHS-Education Appropriations bill. This funding recommendation represents the minimum investment necessary to avoid further loss of promising research and at the same time allow the NIH’s budget to keep pace with biomedical inflation.

Federal investment in the NIH and in programs such as the National Diabetes Prevention Program (NDPP) provides opportunities for substantial returns to the nation. The NDPP is based

on the NIH-funded Diabetes Prevention Program clinical research study which found that even modest weight loss (5-10%) could prevent or delay the onset of type 2 diabetes by 58%. As a result of these findings, the Centers for Disease Control and Prevention (CDC) implemented the NDPP, which has now been expanded to over 794 sites in 39 states; it has been estimated that the program could save the country as much as $191 billion if fully implemented. Moreover, 75% of these savings would benefit federal healthcare programs that provide services for seniors and the poor—individuals who share a disproportionate risk of being diagnosed with diabetes.

The Endocrine Society remains deeply concerned about the future of biomedical research in the United States without sustained support from the federal government. The Society strongly supports increased federal funding for biomedical research in order to provide the additional resources needed to enable American scientists to address scientific opportunities and maintain the country’s status as the preeminent research engine. The Endocrine Society therefore asks that the NIH receive at least $32 billion in FY 2016.
